

Business Model

Callout

Are you struggling to make money from each client?

Are you struggling to get the money fast?

Are you struggling to make more money from each lead?

Then this is for you...

Introduction

The business model is the biggest lever you have... it is literally how you structure your business. And most personal trainers just follow the status quote... you know... they usually just stick to doing consultations or training programs...

But what is way more important... is how it works — because once you can do that, you can go beyond consultations, training programs and all that every coach is doing... and do stuff that's original and mind-blowing...

And achieving that will not only PROVE that you understand your clients, but will also make you a shit ton of money... good ain't it?

Ok so... this step of the video series is divided into a set of substeps:

First we'll start planning out new offers and how to research for them.

Offers take a long time to make... if you want to make them good... so step 1 will be to start making offers for the future... so this is more of a long term move... but on

the long term... man is it good.

If anything, it's your secret sauce to crush competitors because I'll go over making the offer so good that no one can compete.

By the way quick disclaimer... I took most of what I am saying in this section from Alex Hormozi, but I kind of have a different opinion on some things he says.. and also I tailor this all to personal trainers, while his advice is more broad... but you know, just pointing it out for no one to say that I am stealing ideas.

Besides that, I will teach how to upgrade your offer right now...

Along with research prospects to actually create the offer.

Second, we'll go over increasing the LTGP of your offers and decrease the CAC

If you're asking what those terms mean... don't worry, you'll know in a second. Just know this: this is by far... the most powerful piece of knowledge ANYONE could ever give in business.

Then on step 3, we'll talk about how to reduce the price to deliver something to a client.

And specially in your case... the price is not money... but time. How do we minimize time waste per client.. while providing the maximum value we can?

After that, step 4 will be all about reducing break point...

People buy your stuff faster... and by the way, this is something that no personal trainer is doing or talking about right now... so you won't get this advice anywhere else.

Lastly, step 5 will be deciding on funnel structure.. the literal pathway the customer follows

Now quick disclaimer before we start.. I made it so this works no matter where you are in your personal training carrer... I was extra careful... I confirmed everything... and gave you all I could. The only way that this series doesn't work... is if you don't apply it...

I believe that so much.. that if you apply these concepts and don't get anything out of it, I will work for you until you increase conversions by *at least* 50%. I am saying this upfront because I don't believe that's going to happen.

Now.. let's get to it.

Step 1: Plan new Offers and Research

Here's a quiz for you... if you could start a PT business tomorrow what would be first thing you would do?

I'll give you 3 seconds...

Ok so... you probably said one of these 3:

- I would start making content
- I would call out my friends and ask if they are interested in personal training
- I would create my funnel.

They are all wrong... yes it's all very important, but it's not the *first thing* you wanna do.

There are 2 things above everything else...

Number 1: Research

"If you don't know your prospect, you can't help them", "who knows the prospect best, wins". Those are terms that have been around for years... yet so many... so many people disregard research completely.

Research is the secret sauce that will allow you to automate your business,

Now I do not usually believe in secret sauces... but it's the closest to it. It will help you...

Get more from your buck,

Personalize offers,

Make prospects feel understood,

Make them crazy happy and...

Detect Patterns

Grow Big.

So it's very important to get this right and do it well.

And when it comes to research there are 3 fundamental areas:

Behavior

Psychographics

Demographics

And they are ordered by importance.. behavior is the most important...
demographics the least. But it is still more important than all the other irrelevant
areas which were not mentioned.

Behavior

So, as the most important... behavior is their habits and lifestyle. Everything they do is behavior... actions shape the mind and the body...

And if you know what their actions are, you can highlight it to them, make them aware of them and if they are good, reinforce them, or if they are bad... find a way to cut them off and make them a better.

And while doing that process of highlighting it to them or cutting it off, either by content or via call or even in person... you provide an extreme amount of value.

Of course. That's just the tip of the iceberg... behavior helps you in so many more things that this video would be 7 hours just talking about it.

Here are 5 more things it can help with before moving on:

It helps with understanding how prospects move through your business

It helps with understanding how a prospect evolves and grows while consuming your content or when working with you

It tells you "how will they react to this resource I am giving them" (video, pdf, etc...)

It helps with hooking the audience, because essentially, if you saw a video detailing everything you were passing through and your exact situation, you would pay attention.

It will make the audience feel understood, and when that happens you'll sell like crazy

Ok.. so now that you know how powerful Behavior is... how do you collect it?

Here's the thing: Behavioral data is the hardest to collect. That is the reason no one uses it.

But forunately for you.. I've found a few sneaky ways that Fortune 500 companies such as Google and Microsoft are collecting behavioral data;

There are 5:

Forms and Pools

Which nobody does right.. I will teach how to do it right and better then anyone in the industry right now.

Scientific A/B Testing

Which is something I invented by combining A/B testing with the scientific method... which ironically I never saw anybody do... maybe because it sounds scary and confusing (I promise, it's good)

Sentiment Analysis

Which is something insane that has been around for a while and it's an absolute game changer when it comes to organic content.

Call Analysis

Call Analysis, which only works on calls but its sentiment analysis on steroids... basically.

Analytics

Which is every interaction they have with your website.

Before all this, I will talk about CRMs which will allow you to use all this behavior data as ammunition to sell like crazy... I make a lot of mentions throughout and it's less confusion if I talk about them first

CRMs

Now you might now what CRMs are, but their true power is most times untouched....

CRM stands for Client Relationship Management software..

And as it's written, it helps you manage relationships with clients... But that doesn't full enlarge all they do... they help you keep on a relationship with any lead...

They also allow you to register their activity... and that is the silver bullet.

A CRM can manage each person individually... instead of sending email marketing as if people where items on a spreadsheet... with the CRM you can automate and impress.

I will talk more about them throughout...

For now... let's talk about the Forms and Pools....

Forms and Pools

Forms and Pools are by far the best thing to get good **behavioral** and **psychographical** data, fast, and forever.

They are like sales pages, they take a bit of setup, but they make you money until the end of time.

A good form is engaging and can gather a lot of data clearly within one single easy-to-answer question.

Now... Even though you can get psychographical data... I never do over them in forms. You can only ask people to fill up a form once or so every month.. more than that and it gets annoying...

You're much better off learning about their behavior.

We'll go over 2 things:

Creating A Form

Starting A Form

Simple right?

Creating the Form

To create the form you must answer 2 things:

What is the subsection of Behavioral data you want to collect?

When do you want to collect it?

So, let's go over the first question...

What is the subsection of Behavioral data you want to collect?

Inside behavioral data, there is a bunch of subsections... we'll tackle them 1 by 1 in each form we do.... so we must chose which ones are a priority.

This is of course, *dependent on what you sell*, but since you sell personal training, it narrows it down enough for me to create a list of priorities for you...

With explanations why the ones I put first are the most important. So make sure to check it bellow the video...

Behavioral Data Priority List

If you ever answer the questions to all the forms I set for you... then it's time for you to make your own.. the explanations on the Behavioral Data Priority List will explain why picked those subsections first or last... and that will allow you to know how to go about creating more questions and prioritizing them...

Just know that in the end... prioritizing questions is a game of experience.

And then the next question:

When do you want to collect it?

Now... many people forget about this. Before you do the form, you should consider, *who* do you want to ask this to?

Who means when in this scenario... if you're like "wait what?". Let me give you an example:

If I am a content creator, I will ask questions about behavior to my **viewers**, via Instagram polls for example. That will make me know about my **viewers**.

A bad move would be to ask the same question to my clients.

Think about it... people evolve through your funnel, a viewer may be unsatisfied with their physique, while a client **NEEDS** to be satisfied with results for this to work.

I am not saying viewers and clients are different people, quite the opposite... the viewer is an earlier version of the client before their transformation.

Every intricate step in your funnel is a moment on the timeline of your prospect what we call — buyer's journey.

And by intricate step, I mean clicking a button, opening an email. Etc...

That would give the best results... of course... you can't go so granular on your prospects and their journey through your funnel when you start out... so keep it simple and go more detailed over time... here's a good place to start on their timeline:

Before they knew your business

After they consumed some content

After they opted in

After being in the email for a while

After one consultation

After being with your for a long time

Now, fortunantly for you... since I've identified the questions... I already have made the forms for these 3 moments in the broad timeline:

After being in the email for a while

After one consulation

After being with your for a long time

Because it's hard to get the other 3 using forms.

If you read see the forms... I left notes on my thought process and how to word the questions... this will allow you to know how to make the forms if you ever have to do it by yourself.

It's 117 diferent forms, 3-5 questions each... I don't think you'll ever run out of forms, that's why I am saying *if* you ever need to do them not *when*.

Forms for Personal Trainers

Ok... so now you got the form done... let's start it...

Starting A Form

When starting it, there are 3 things that matter:

How many people will we send this to?

Who will we send this to?

What will we do with the submissions?

Firstly...

How many people will we send this to?

This of course, only applies if you have a private channel. This would be done on email marketing and SMS marketing (more on both of these in Getting Leads in the Door, the step 2 of the video series).

You can also apply it on your site via a chatbot, but that is a timeconsuming and advanced move.

Form Data Becomes Representative of a Larger Group from 800 submissions upwards. So you want to send 16000 emails asking to fill up the form...

Why 16000? Of the people who are in your email list, only 1/20th will respond to the form you asked them to fill... and that only if it has less than 5 questions.

$$800 * 20 = 16000$$

This might also remind you of something... if your email or SMS lists have 32000 people or more.. you can ask 2 questions at the same time — and that is correct.

An important note though...

You shouldn't treat the people on sms and email as 2 separate people, a lead can be both on SMS and Email... That is why we are using a CRM to send the emails... you need to send it at a people level.

If you do send it through SMS and Email Softwares... not only will be your data in silos (which means disconnected by the way)... people will receive repeated requests instead of only 1 sometimes... or even worse... completely different ones.

Who will we send this to?

You've already answered the question: person at this specific point in the funnel.

But let's say they are on a newsletter... there are all kinds of people in your newsletter... people who want to lose weight, people who want to look pretty... people who are runners... and so on...

Those are called segments..

I identify my segments via a CRM... there are a lot of complex ways to analyze them, but my favorite 3 are:

Using the Opt-In

Using calls

Using track history

Let's cover these 3 real quick...

Firstly...

Using the Opt-In

This is the best method when your leads get in the door — when they opt-in.

You want to have more than one opt-in for different segments of your audience... more on that in the next video though.

The point is... after they sign up to the opt-in. CRMs will do their magic.

CRMs usually have a tagging system.. what you can do is.. when they opt-in to say... an opt-in for weight loss.. give them a tag on weight loss.

The other way we can segment is by...

Using calls

This is always only reserved for MQLs (which by the way means Marketing Qualified Leads... as in leads who passed through your marketing campaigns and are believed to be a lead you can sell)

But it's way more detailed than using the opt-in. Because the person on the call who was with the prospect manually writes to the CRM information...

So it's by far the most detailed info on the list.

The last way we can segment by is:

Using track history

And this is particularly useful you want to send a specific promotional email.. Imagine you send a warmup video for them on email (more on that in the last video on the series) and they watch 5 minutes of it...

Through clever Analytics, which we'll go over as the 5th research gather method we can register this... And think about it:

What would you think of person who watched 5 minutes of a 5 minute supplement video? They are probably interested in supplement and which they should buy, right?

So use that; If you have a supplement affiliate for example... you could send them an email saying that you saw that they saw 5 minutes of the supplement video, and give them some supplements that you recommend... and if they are good enough.. they will appreciate...

OR even better... if the person who saw the video was one of your clients on group coaching or 1-1 coaching... when they achieve their goal... give them a free supplement you recommend and tell you gave it because you saw they watched 5 minutes of the video you sent a while ago.

This goes more into the bonus at the end of video 3... so I'll drop it there... if you're curious, then watch the whole series and at the end you'll like the surprise.

And this is just the tip of the iceberg of what a track record can do.

Ok... so, let's go back to starting the forms.

Let's assume you already have them identified...

When your CRM list is small: <200k people. You want to target your audience as a whole... that is just send the emails to random people...

For real... that is the most popular method in science for forms...

If you only ask runners, then you will know about runners, not your audience on average.. so be diverse and ask anyone.

When you eventually reach 1 million people on your contact list, you want to divide your audience into 4 groups... people you identify that fall into certain categories.

And then, ask on each category the form questions... this way you know each individual segment of your audience. Basically going to more granular detail...

Do this on a scale of 10... when you get to 10 million, divide your audience into 16 categories... 100 million? 64... Now you probably will only get that big a few years from now... but it's good to have a long term plan and I am giving it for you...

Doing it on a scale of ten seems to be the perfect balance between going deep and going broad..

This way you can ask a lot of different questions at the same time while going more granular over time. Without going overly diverse or granular.

Of course... this is just a hunch, I don't have data to prove a scale of ten is good.. when you get to 1 million people, start to test it out as you scale.

But now, we'll go to the exciting part...

What will we do with the submissions?

First... we will register them to the CRM, this way we have ammunition when we sell.

Next... we'll see the answers and note them down to our ICP (which stands for Ideal Customer Persona), other people also call it Dream Buyer, Buyer Persona, but ICP is the term that has been around for the longest time.

Now... most personal trainers do not have an ICP of their audience, which is bad... very bad... Don't you worry... lil'ol me is gonna help you out...

I made a template for your ICP that you can fill up easy.. I left a PDF, Google Slides and Word Version... Just fill up the slots it gives with the research I am teaching you how to do now...

ICP

I also left some notes on how to expand this ICP as you grow your business. (at the bottom)

Ok... believe me.. this one was the biggest in the research... now let's go over the next one...

Scientific A/B Testing

Important Note:

A/B testing is used when you run out of options, when you've already set up all other research methods.

Because... It's not automatic at all — it's manual — but one of easiest ways to know more about your customer manually — once you have been in business for a long time.

I will teach you how to make it, and better than anyone in the industry. But I highly recommend setting up all automated methods such as analytics, forms, sentiment analysis and call analysis first.

Ok so this is something no one does. Yeah, yeah... everybody does A/B testing... also called split testing... but they let me ask you something: when was the last time you wondered why an A/B test works?

People usually do A/B tests like this:

They create a different version of the thing

They see which performs best

They pick that one

And they never consider why it's that one.

We'll be different and do A/B Tests the way Science says it must be done... And this is actually based on Ancient Greek Scientific knowledge... so I honestly don't know how so little people figured this out in business.

This is not the scientific method though... it's a modified version for A/B testing. And there are 4 steps to it:

We start by the results of an A/B test — the observation phase;

Then we see what changed on either version — the research topic area phase;

If it was copy that was being A/B tested, we can make a lot of hypothesis: is it because it's smaller, does it hit a specific pain point? Etc..

So we pick the one that is most probable to be true...

And instead of having all A/B tests already cooked up, we just create a new version of the copy — at that moment, changing only 1 thing to test that hypothesis.

We run the A/B test again, and we analyze it. Then we go back to start and repeat.

Pro Tip:

Don't create all A/B tests at once.. create 2 versions at first and based on the results make assumptions and create a new version testing those assumptions...

That's it... very simple isn't it?

But specially powerful when you want to collect data about behavior.

Now this research method is not going to help you understand the prospect that well, but I decided to include it anyways for one reason only:

Sometimes... it let's you reveal something you never though of before... because when you eventually to the why behind things you can understand a lot:

- Oh my audience reads shorter copy
- More of my audience resonates with this specific habit then this other one <<banger
- More of mu audience has [situation] going on <<banger

And so on.. A/B testing a long-term game... but doing it this way make it it snap and skyrocket sometimes. and that is why it's so powerful.

And by the way you want to keep a handle of the data;

There are 2 thing you want to do to keep a handle of it:

Register it to the CRM

Document Changes

Let's talk about the first one:

Register it to the CRM

Register which split test the prospect went through in the CRM... it doesn't do much but sometimes it can flint ideas in your brain, specially if your A/B testing something big... such as hooks and value of your VSLs;

Which is very common at the start;

If you don't know what VSLs are it stand for Video Sales Letter and it sits in the section of landing pages... (one of the most complex and important elements of a landing page by the way).

Then you want to:

Document Changes

Basically, just write down which split test you did and on what you did them, what were the metrics after the split test was done is also important.

Doing this will allow the data to be stored somewhere, and in case of doubts it can be revisited, it's also important to make assumptions of other A/B tests and allows you to connect the dots by having one place with all clues you need to understand the why.

I would never disregard documenting any changes.

Ok... so after the A/B test it's time to talk about...

Sentiment Analysis

This is basically analysing what people say about you only... it's very useful for psychographics.. but sometimes it can reveal that certain videos do better than other... probably because they resonated better with the audience...

If you ask questions during your videos for people to answer in the comments (which we'll cover in the second video) then you got a lot of data right there...

The software tool I recommend for this is [Buffer.Com](https://buffer.com) — Have a look at them.

Ok... this one was very straightforward right? Next one:

Call Analysis

This is sentiment analysis on steroids but it only works on calls.

The tool I like to use is [Gong.io](https://gong.io) it basically break down objections, obstacles, pain points... and way more data through the call that can allow you to know of behavior...

But it's mainly psychographics based.

"If it's mainly psychographics based why are you covering it in the behavior section?" — Because it also works, and this way I don't have to cover it when I'm in psychographics.. I just have to mention it... and going over all of them at once just makes more sense for the structure of the video series.

But don't worry because this next one helps a lot with behavior:

Analytics

Analytics are direct metrics... sentiment analysis, call analysis some might argue that this is analytics and yes analytics is the study of data and they are included, but when we talk about analytics particularly for business... I mean all data that is taken from source.

For example, average time watching a video. Conversions. That's all analytics.

How can these help us see user behavior?

Well, let's say that I was running a website... how could I figure out what most resonated with my audience... what about the section on the copy that they spent

most time reading? That's a great example of the prospect paying attention... usually they only pay attention when the copy is good.

Analytics gives you clues... it's not perfect, but it can certainly help with behavior...

There are 3 kinds of analytics that are particularly helpful in behavior:

Heatmaps

Session Recordings

Traffic Breakdown

Are there more? Yes... but they are quite diverse... and I wasn't able to make another "kind" of analytics from them... I left them out... I plan to do a resource on that... but nothing for now.

NOT A PRIORITY:

So I have left them listed out in a "research analytics metrics & charts list". Long name... but it's self explanatory...

Research Analytics Metrics & Charts List

So now.. let's get to the 3 kinds of analytics:

Heatmaps

Here's an example of one:

It's pretty self explanatory what they do... they allow you to know what the user looks at most... which combined with A/B testing can give you pretty good theories about how your prospects think.

You might think this is not powerful... you're wrong... they are particularly powerful... because they allow you to know where the user looks most at... what

get's their attention. So it's powerful... specially when you want to guide the viewer somewhere...

Session Recordings

Ok this one is also one of the most powerful things... it literally records the viewer as they move through your website (fyi: this is what generates heatmaps)

This will allow you to know a few things:

What people get confused with

When people stop watching your vsIs, annd...

How much time they commit to reading your stuff

This will be useful individually and collectively.. collectively to understand average behavior... and individually to help with calls...

Though individually for this is though so I would focus on collectively.

Now, to do heatmaps and session recordings... use Hotjar... no joke, best tool for this.

Lastly we have the...

Traffic Breakdown

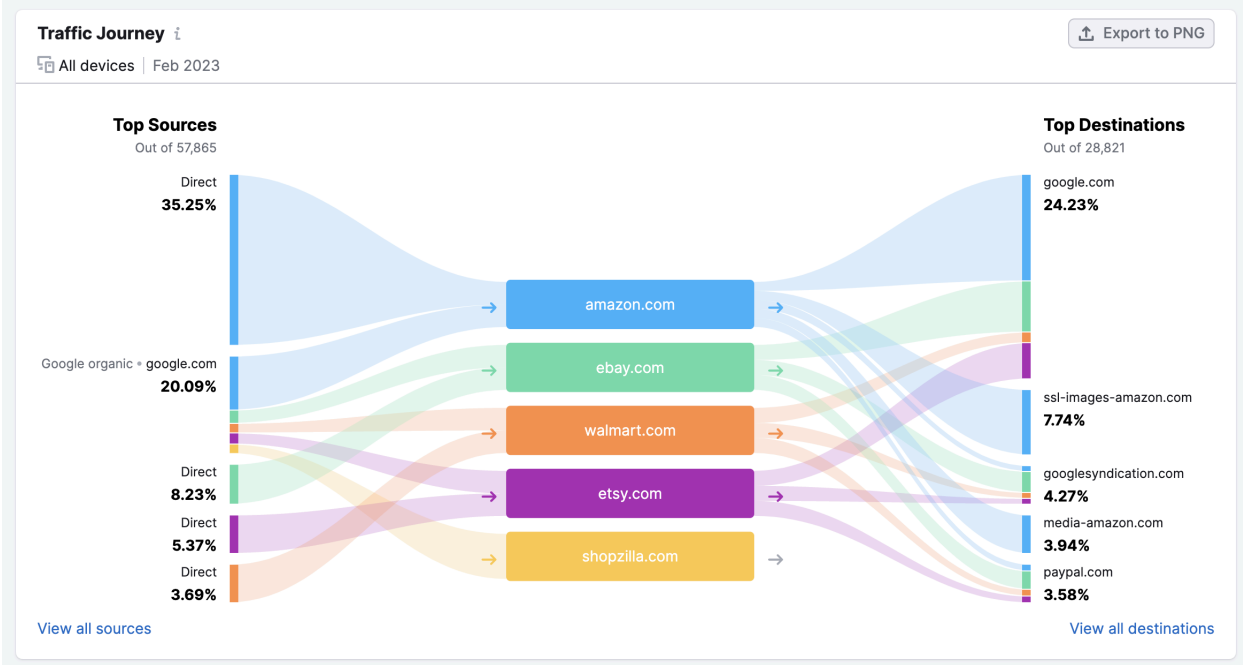

So this is very simple.. where do you get leads from... which when you start out, your only source should be your social media... which you should only have one channel - more on that in video 2... but when you start out (I'm not saying now...) you should only have one channel.

So after being in the industry for a while and growing a fair ammount... and having multiple channels such as youtube and instagram... then... you might get leads from various places...

Traffic breakdown allows you to know where you get the most leads from...

If you want to go one step beyond, register where they entered from in your CRM... then you'll be able to see data more clearly... for example... people on tiktok with higher standarts... might have lower click rate on your emails.

Get a handle of that kind of data will allow you to know the behavior of each user in each platform... allow you to adapt to that platform so much better... here's an example of a traffic breakdown graph from semrush.

Alrighty... now that you got behavior research down... don't worry... the other ones will be quick.

Psychographics

Ok... so psychographics is what is happening inside the mind of prospect... behavior is what they do.. psychographics is how they feel about it, or other things such as what they are thinking on, what they expect to happen, etc...

And besides the methods we just went over... which all also work on psychographics (though I do not use forms for psychographics, just a reminder).. there are a 2 extra methods which I use that are very effective... not automatic at all... but they are effective.

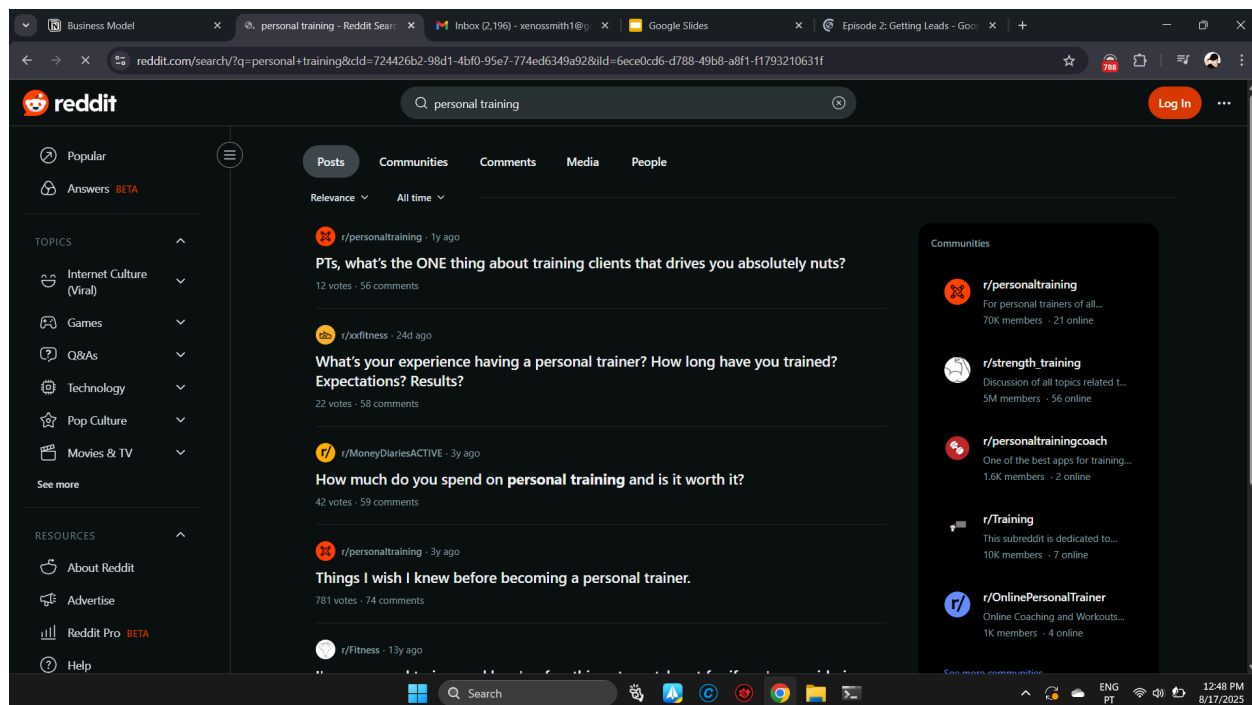

Manual Audience Notetaking

Coaching Call Notetaking

So let's start with

Manual Audience Notetaking

This is very simple... go to somewhere your audience hangs out and start taking notes about things that are important for example:

You have a goldmine here in reddit if you just search for personal training. It's really anywhere they hang out... comments section of other personal trainers... google search...

On google search is a bit harder to get information... unless you use a tool like answerthepublic.com.

Which I do recommend you having look.

Then the next one...

Coaching Call Notetaking

...is about taking notes on a call about their psychographical state...

But then you might think... their psychographical state is very broad... where do I start from? The answer is in the resource...

I left a list of the things you want to know about your prospect, have a look at that.

As you can see the psychographics was quick...

Demographics

So... this is their physical appearance... fortunately for you... I have done this for you.. grab it in the resources

Prospect Demographical Analysis for Personal Trainers

Ok so... research... that was a lot

Number 2 - Your offer

I talked about reaseach BEFORE the offer;

Because to make the offer you need research... now you might be asking me: "Guy which I don't even know the name of... why are you telling me about research and offer"; Maybe you even asked this at the start.

And I told you it was your secret sauce;

If there is one thing that can increase conversions is making your offer so good that people feel stupid saying no.

There is a course by Alex Hormozi on how to do this... it took my ideas from it. *It's free...* I do recommend having a look so I'll leave the link in the video... but the problem is that... his course is general and not to personal trainers...

What I am about to tell you is a framework to create any offer for personal training you ever need... along with ideas... I will also cover why you need more then offer in business... at least on the long term.

Now... when creating a good offer for business owners... there are 11 steps:

Create the roadmap

Think through the value formula

Create objections

Create flavors

Create solutions

Trim and Stack

Charge it's worth

Package Solutions

Create the Guarantee

Decide on Scarcity & Urgency

Give it a name (not headline)

So the first step its to create the roadmap... and the best way to do it is to answer 1 question. And doing this early will allow us to just stop constantly checking our research, which will save us a lot of time down the line.

The question is as follows:

What are the feelings they go through, and actions they take when working with you.. from when to start out to when they finish?

Let's break it down:

What are the feelings they go through, and actions they take when working with you.. from when to start out to when they finish?

On the first question I want you to tell me. Of the current offer you are giving... main offer.. or offer you want to analyze.. What are the feelings they go through, and actions they take when working with you.. from when to start out to when they finish?

For your prospects. It might involve working out every day, following strict recipes and cooking, all the way to cleaning the dishes.

Create a roadmap of their evolution, feeling, actions, and interaction with you... from begging to result of this offer.. and save, we'll use it later...

If you want a bullet list, here are the things that are important:

- Moments of Sacrifice + Mention the specific action
- Moments of Effort + Mention the specific action
- Moments of Any Strong Feeling
- Moment in timeline
- What led to this

Do this list for every item.

I have left in the resources a free prospect roadmap to start out... highlight *start out*. You'll need to change it a bit.

Prospect Roadmap

Ok so... after asking these questions.. we move onto step 2:

Think through the value formula

When people hear the word formula they get scared... but believe me, something this simple is nothing compared to the math we did in high school.. basically:

$$Value = \frac{Dream\ Outcome \times Perceived\ Likelihood\ of\ Achievement}{Time\ Delay \times Effort\ and\ Sacrifice}$$

This is very easy to understand:

If you increase the result the result you'll increase the value:

Example: going from 20 to 40 pounds

If you increase the (perceived) chance of getting it - you increase the value

You'd pay more for the same surgery with a higher likelihood of success

If you decrease the time to do it you increase the value

Getting 20 pounds less in 2 weeks is way more valuable then in 2 months

And if you decrease the effort they put in or what they have to sacrifice to get the goal, you increase the value.

Losing 20 pounds while grinding is way less valuable then losing 20 pounds while going about your life

So what I want you to do is to see how valuable your thing actually is by applying this.

I want you to take out a piece of paper if you haven't already... and go through this thought process with me.

From 1-10; How important is the goal you provide on your 1-1 training for the lives of your prospect... and do not make assumptions on this... I have seen many assumptions that are wrong... use the research methods I gave you to find out.

And plug that into the value formula:

$$Value = \frac{1/10 \text{ Value} \times \text{Perceived Likelihood of Achievement}}{\text{Time Delay} \times \text{Effort and Sacrifice}}$$

Then ask yourself... how likely... if they put in the work are they to get the goal. Come with a percentage.. 90%, 80% whatever. Give the percentage from 1 to 100.

Divide it by 100. And plug that to the value formula...

$$Value = \frac{1/10 \text{ Value} \times \frac{\text{Percentage}}{100}}{\text{Time Delay} \times \text{Effort and Sacrifice}}$$

Then ask: how much time in hours it takes to complete this thing.. if you can only say in months, multiply your months by this number:

720

If you can only say in weeks, by this one:

And in days... by 24 hours.

Then plug that in:

$$Value = \frac{1/10 Value \times \frac{Percentage}{100}}{Time In Hours \times Effort and Sacrifice}$$

Lastly, I want you to rate from 1-10... how much effort does the person goes through when completing your service.. such as the example I gave earlier: 1-1 personal training.

$$Value = \frac{1/10 Value \times \frac{Percentage}{100}}{Time In Hours \times 1/10 Effort}$$

This is essentially giving you a feedback for how your offer is. And at the end of all the steps and you thinking on your offer, you'll use this same process to see if your offer has improved and using this framework, you can just keep improving it over time.

Pro tip: do this 3 days after thinking out the offer. Because when you work too hard on something you grow affection to it.. and then your numbers such as how valuable is the outcome and the effort they put in will be distorted... giving a 3 days rest will allow you to refresh all that and give an honest feedback on it.

It's important to point out that right now we're calculating the true value of your thing, not the perceived value by your audience... after all this I will teach you techniques on increasing the perceived value of your thing... so don't worry about that if you had that in your mind.

So now let's create objections.

Create objections

To create the best offer possible we need to address the issues and turn them into a feature. This instead of fixing them down the line when the customer highlights it... which is way more resource intensive.

So... how do we do this?

What are the feelings they go through, and actions they take when working with you.. from when to start out to when they finish?

Remember the roadmap that this question generated? It's time to use it...

By this point... you'll have listed every single thing they will need to think about to get the result... where they apply effort and sacrifice.

What we want to focus on is solving problems... so to do that... I want you to grab every item of the roadmap, in order, where there is effort, sacrifice or negative emotions evolved...

And then put them on a list...

Please know that this list expands over time... we can't remember every single thing there is to know about a person in one sitting...

Now... We're not going to find a way to solve it yet.

After you have the list... the job is to break those objections down because what we want is a bit more granular than just an abstract objection.

Create flavors

So to do that... grab the first objection. And grab the 4 elements of the value formula... think through what might they argue about in each one.

Now, the flavors do not need to be exactly for... they can be more or less. But if they are less... please look further because they are very rare... here's an example for you to understand how... huge this list is going to become...

Let's say that your client goes grocery shopping for nutrition. First.. I will assume that your offer has no guidance on this.. and I will tell the problems involved with it.

The first part of the value formula is the outcome:

- It's not worth financially worth it to go grocery shopping

The second is perceived likelihood of success. This is where it starts to get crazy. There are 3 variants I've found so far.. and one of them has a multiplier. So let me show you:

- It won't work for me specifically
- I won't be able to stick with it
- External factors will get in my way

Now for the actual grocery shopping example... here's the flavors of perceived likelihood of success:

- I have XYZ condition and this nutrition won't work for me
- There are no grocery stores near me.. it won't work for me
- My wife always wants to eat out, and then what? [variant 3]
- There is nothing at the store to make the meals. [variant 3]

Variant 3 can be used multiple times and it's very dependent on the specific problem you're solving... so keep that in mind.

If you can't come up with these examples yourself... I have left some offer examples in the resources.

Offer examples

Next we have effort and sacrifice...

- I don't know how to grocery shop, I don't what to buy
- I don't know where to go, all these shops are too confusing and I don't know which sections to go to
- I HATE grocery shopping.
- I am terrible at grocery shopping

And lastly we have time

- Grocery Shopping takes too long to do
- Going there because of the traffic will take at least an hour
- Grocery shopping doesn't fit my schedule.

Now this was just an example... and you want to do this for every objection you have.. so... here's a checklist of all thing you want to cover... per objection...

This will not be financially worth it.

It won't work for me specifically

I won't be able to stick with it

External factors will get in my way

This will be too hard and confusing to figure out

I won't enjoy it

I will be bad at it

This will take too long to *happen* (think of the transit example when going grocery shopping)

This will take too long to *do* (like the actual action of grocery shopping)

It won't be convenient for me (won't fit my agenda)

Take a screenshot or you can check the slides I am going through in the resources... it slide number XXX

After going through this checklist through every objection you have and detailing the flavors.. which I recommend doing a mind map for this... grab another sheet of paper and put the mind map besides it.. or if you are doing this on a notebook... turn the page, because now we'll use these flavors to...

Create solutions

Now there are two ways you could go about this and the second one is my favorite... First you could just think of an flavor of an objection and flip it... that is:

You get an objection like: It won't be convenient for me (won't fit my agenda). And you flip it to: how can I make this convenient?

And then you just list out everything that comes to your mind.

This method is simple but for some people it works best... but if you think that's a method that is too hard for you... then we can use the second method:

The delivery cube. [it would be cool if you could create an actual cube]

And the delivery cubes is broken down into 6 faces... it's a cube after all:

The Scalability

Service (DFY, DIY, DWY)

Solution Consumption Method

10X to 1/10th test

Support (2 elements: Support Platform & Supporter)

Speed and Convenience

By the way... it's a cube so all these elements interact with each other... even the ones with opposite sides... I've checked, it's there is no physical object with 6 faces that has all faces touch another 5 faces.. so we'll leave it at that.

Let's go through each element of the cube and how we can use them in each flavour.

The Scalability

Here, we're talking about how scalable your solution is. If it's a 1-1 solution such as personal help then it's non-scalable. Now it's important to point out that lack of scalability doesn't mean personalization.

Personalization can be offered in scale with data. For example, when you've been a PT for a long time, you'll be able to use the data you've collected about your prospect to create a tool to help them in a certain solution.

A tool is personalized and scalable.

For scalability... there are 3 options:

- 1-1
- 1-Small Group
- 1-Many

So what I want you to do with your flavour is to think of how you could solve it 1-1, 1-Small Group, and 1-many. For now.. what I want you to do is for your sheet of paper to look like this:

- [flavor of an objection] + 1-1
- [flavor of an objection] + 1-Small Group
- [flavor of an objection] + 1-Many

Now let's go to the next one...

Service (DFY, DIY, DWY)

The *Service* face of the cube, decides how much does it do for the client. Here we have a spectrum. From, they do it themselves... to it's done for them...

To be done for them (DFY)... all they need to do is answer some questions... it can be done by a tool... or another system... or you.

To be do it yourself (DIY)... they do it all themselves....

And then of course there's the in between...

And this service type interacts with a few things... DFY is usually less scalable than DIY, *usually the tools are a great example that breaks this pattern*. However DFY is the most valuable, because they have to do the less work... if we look at the value formula... we reduce the effort and sacrifice to almost 0.

And if it gets to 0 the value is infinite, because you can't divide by 0:

$$Value = \frac{Dream\ Outcome \times Perceived\ Likelihood\ of\ Achievement}{Time\ Delay \times 0} = \infty$$

That's why getting to 0 is impossible.

So now... on the 3 variants of the first flavour , for each one... think about how you could make it a DIY, DWY or DFY. You'll end up with 9 variants for the first flavour you're doing this in. And I want them to look like this:

- [flavor of an objection] + 1-1 + DIY
- [flavor of an objection] + 1-1 + DWY
- [flavor of an objection] + 1-1 + DFY

- [flavor of an objection] + 1-Small Group + DIY
- [flavor of an objection] + 1-Small Group + DWY
- [flavor of an objection] + 1-Small Group + DFY
- [flavor of an objection] + 1-Many + DIY
- [flavor of an objection] + 1-Many + DWY
- [flavor of an objection] + 1-Many + DFY

You might be asking why we're listing them out before we solve them... because of something called batching... you'll batch this creative process after you got everything you need so you don't need to back and forth and wait.

Now to the next element...

Solution Consumption Method

The consumption method is essentially how they get the value... is it live, video, audio, text or a tool?

And this will break down your current flavor to 45 variants... That look like this:

- [flavor of an objection] + 1-1 + DIY + Live
- [flavor of an objection] + 1-1 + DIY + Video
- [flavor of an objection] + 1-1 + DIY + Audio
- [flavor of an objection] + 1-1 + DIY + Text
- [flavor of an objection] + 1-1 + DIY + Tool
- [flavor of an objection] + 1-1 + DWY + Live

- [flavor of an objection] + 1-1 + DWY + Video
- [flavor of an objection] + 1-1 + DWY + Audio
- [flavor of an objection] + 1-1 + DWY + Text
- [flavor of an objection] + 1-1 + DWY + Tool
- [flavor of an objection] + 1-1 + DFY + Live

and so on...

And this might sound like a lot... but essentially, if we do this work at the end... this will give us endless possibilities on solving the problem. And we'll probably never have to worry about what to do again.. you'll probably only do this once per offer and then you can keep on inovating.

Don't worry... we're almost done... one more...

10X to 1/10th test

Ok now this is important... this is an exercise... if you 10Xed your price tomorrow, how could you make this solution worth it?

And then we have the other test... if someone grabed you by the neck and forced you to reduce price *and time you put in* by 10 times... how could you provide more value then you currently are giving?

This will get you thinking in volume and efficiency.

This won't expand your list... you'll apply this test to each of the 45 items of your flavor.. why? Because this way.. you 10X the value of that element or more... while keeping the delivery cost. We do the 10X test first... then the 1/10th test.

We'll talk more about reducing delivery cost latter.. so if there is one point that you can't come up with just save it. You can always revisit this process after all.

Now... do this list for each objection you have... if you have at least 20... it will take a about 30 minutes... it scales uniformly.. so if you have 200... it will take 5 hours.. however.. understand that the more work you put into this... the more likely is your offer to be valuable and work down the road...

So what I recommend is going all out.

Now... lets go over 2 more faces that are a bit diferent. These 2 faces are diferent because first... they do not mean your list specifically... but overall... in the entire offer.. for example:

Support (2 elements: Support Platform & Supporter)

It has 2 elements... sorry I couldn't make a cube with 7 faces... This is the overall support you give through the process...

The support platform is where you should talk with prospect. Emails, via phone, sms, etc... split test it and see what works best... use your research to have a good initial direction.

Then the supporter is essentially who responds... is it just a normal person you hired to take care of it... is it a chatbot... or is it you? An expert?

You want to split test that as well... you could start with yourself... as you scale you could pay to have a chatbot and put it on the platform that you already split tested works best...

Doing this will maximize the value. And this is done on the offer level... after all, you don't want different support rules.

Same thing for this other face of the cube...

Speed and Convenience

Which is also related with support. Basically: How fast do you respond to leads... and when are you available.

Let's break the first element down... how fast you respond to leads is directly correlated to value, the fastest the better.

And on convenience... the more you're available... the better. So if you are available 24/7... that would be the best... but remember that this interacts with the support element we just went over... can you, the expert, support a prospect 24/7, or would you switch 9-5, Monday-Friday?

But I bet a chatbot would be available 24/7. So the point is... try to find a balance between these 2 faces of the cube.. split test what works best...

OK.. those were all the faces... now... after you've created a list for each element... it's time to generate solutions... just think how you could do it... on each bullet point... we left exactly what we want... so now.. we just find a way to get the answer for the bullet point. There is NOT always an answer... or you can very hardly get a good answer... for example

- I HATE grocery shopping + 1-1 + DIY + Text

This is very hard to find a 1-1, text, DIY solution for this... but if it was a DFY, and a tool. We easily good... we just gamify the process using an app.

Certain combinations are impossible... for example... a Tool that is DIY has no value and as such we should just cross it and not think about it

This will save you some time on the thought process...

And do not worry about one solution fixing multiple problems... actually, preferably search for them... they are exactly what we want.

Now... after you've done this thought process.. of course we're not going to do all the solutions... we're going to do the ones that work. To decide that, we'll move to step 6...

Trim and Stack

Now that we've got this HUGE list of things, we will trim and stack to max out value and minimize cost... how do we actually do that?

We'll use the value formula and some good intuition.

First... I want you to grab each solution you came up with... and apply the same process we used to quantify the value of your offer, and put them all in a google spreadsheet...

I have left a google spreadsheet template in the resources section, check that:

[Google Spreadsheet Template](#)

I actually like to use airtable for spreadsheets and not google sheets... but you'd have to make a new account and I can understand that's a pain the ass.

Here's the formula if you don't remember:

$$Value = \frac{1/10 \text{ Value} \times \frac{Percentage}{100}}{Time \text{ In Hours} \times 1/10 \text{ Effort}}$$

After doing that for each element and getting and getting their value on a spreadsheet.. ask this questions per item:

How many minutes does it take me to apply this solution?

How much does this solution cost me in dollars?

We'll use this to quantify the cost.. An important thing to keep in mind is that cost is relative to your yearly income... however... what we will do is grab the least costly... the 25% least costly...

For you to have no idea of what I mean... here's a graph:

And we'll use some google sheets magic to do this.

Now... on doing this: you'll calculate the price for each item... at this stage you should have the value calculated... there will be 2 columns in the spreadsheet to answer these questions...

After that, you'll go to the filtering options, I have left a filter for you to use.. the video editor is showing the process as I speak... I hope... right editor?

Then after this... I also created another filter for value. Go the the X Column and apply it.

I *REALLY* Hope the editor is putting this on the screen.

After that, you have a list of high valuable and low cost solutions... so now your job is simple..

Go through the list... and if one solution solves multiple problems that other solutions solve, eliminate the solutions that solve 1 problem, and leave out the

solution that solves multiple problems... this way you have more powerful solutions and less cost.

If there are any repeated solutions remove them aswell.

After doing this you'll have a cleaned list of all solutions that are low cost and high value... which is very powerful...

Now before ending the trim and stack phase.. it's important to note that 1 high cost, very high value solution, might close a lot of deals..

So what I like to do before finishing is to just go the last column... checklist all current solutions like the recording shows, temporarily remove the cost filter. And change the value filter to my "highest value filter"... which will give you the 2 highest value solutions independent of cost, and checklist those... IF you can handle them.

Then you'll disable all filters and just filter by checked boxes on the last column... and before finishing... see if the highest value solutions solve any problem that another solution already solves... and eliminate that solution for efficiency...

With this... trimming and stacking is done... and you've successfully created the meat of your offer... now the rest of the job is very easy...

Step 7...

Charge it's worth

This is basically deciding on the price... think of all the work you've done... and name a price...

You will not find any comparison in your industry... you're the first person to do this offer because you did it from scratch... your playing in a market of 1... and that has the best upside ever... no one can compare you to anyone... and as such they must think through the actual value you're giving.

And do not be modest.. be fair about what you're giving... because don't worry.. we're going to use something 2 or so steps from now to make the prospect stop worrying about the price.

Step 8...

Package Solutions

After you decide on the price.. it's time to decide on how do we actually package this.. and you might be like "What do you mean"?

So here's your current offer:

[Bunch of boxes stuck together like tetris to make a large box]

What I am going to do is this:

[Boxes on the core offer] + [Boxes on the bonus], [there are bonus and core offer titles above the boxes]

And you might be asking why. It's called making a cross-sell out of thin air. For example... if I gave you 17 knives for 30\$, you'd think that all the knives are crappy, but if I gave you 1 knife for 30\$... plus 16 knives extra... then it would be worth a lot...

On the spreadsheet you used to trim and stack there is another column called packaging... you'll, per solution you have... ask a single question:

Is this absolutely essential to be on my offer?

If the answer is no.. you go to the packaging column and pick the "bonus" option.
If the answer is yes... pick the "core offer" option.

And this will allow you to create bonuses... a very simple process... but they will be very powerful on your page.

Now... lets save the bonuses and move to step 9 of creating an offer...

Create the Guarantee

First... even though I say singular you can have more than one guarantee. But it's too confusing sometimes and I just prefer what is simpler...

Next... I know that many people are afraid of guarantees. But believe me... they are worth it... and I'll explain why..

So as a marketer... over the last few months I have created a lot of resources detailing the math of guarantees and why they are not dangerous. So, here's the math:

To make a good example, let's use fake numbers:

LTV: 1000\$,

CVR: 5%

Old refund rate: 5%

Let's say 1000 leads come in:

$1000 \text{ sales} * 0.05 \text{ (CVR)} = 50 \text{ sales}$

$0.05 \text{ (refund rate)} * 50 \text{ sales} = 2.5 \text{ refunds}$

$50 - 2.5 = 47.5 \text{ customers}$

That is: 47,500\$

Let's make the guarantee more extreme.

Then numbers turn into this:

LTV: 1000\$,

CVR: 10%

New refund rate: 6%

So let's say 1000 leads come in:

$1000 \text{ sales} * 0.1 \text{ (CVR)} = 100 \text{ sales}$

$0.06 \text{ (refund rate)} * 100 \text{ sales} = 6 \text{ refunds}$

$100 - 6 = 94 \text{ customers}$

That is: 94,000\$

By making the guarantee more extreme you gain an extra 44500\$ in revenue.

Thing is... a free converts 9 times more then not free... because there is no risk... and a guarantee is free on the backend... so done right.. it can increase conversions up to 4 times.

Now quick disclaimer... the hardest part about having a guarantee is usually starting it... it's perceived as a risky move at the start and because of that most people don't do it...

And they lose a lot on it... so try to test it out with little risk and see how it goes... how do you exactly test it out with little risk? Using a conditional guarantee...

Now before I get to the conditional guarantee... I want to say that there is one more, the unconditional guarantee, which I'll talk about next.

So the conditional guarantee comes in a lot of flavors... it's basically... "if you follow this condition and don't get result in Y time... then we will..." and then you give your guarantee... the condition can be as you set... "if you workout every day" for example.

Just remember: Independent of what conditions you set, you should always give something "better than money back".

Here are some examples of things you can do:

Outsized refund (2-3x cost of product/program/service)

Service Guarantee (keep working with them for free)

Modified Service Guarantee (keep working for double the time free)

Credit Based Guarantee (give them credit towards other programs)

Personal Service guarantee (you will help them 1-1 until they reach the goal, so if they were on group coaching they pass to 1-1 coaching for free)

Wage Payment (we will pay you your hourly rate for every hour spent with us on top of the cost of the program, this is very useful in courses)

Delayed Second Payment (You won't bill them again until after they make or get their first outcome)

After this we have the unconditional guarantee... which is pretty obvious... it's the average 30 or 90 days money back guarantee. Very useful in programs or courses.

Step 10...

Decide on Scarcity & Urgency

Now it's time to *ethically* give them a reason to act... and that's where scarcity and urgency come in...

This is basically tell this... "this offer is going to end soon so please buy"

This is what gucci and rolex uses to make so much money... the factory has a limited supply of only 3 or so per hour so they use that as a scarcity... please do keep in mind that the scarcity these luxury brands create is a lie... but it works... I will teach you how to do it *ethically*... so don't worry.

Before we start out it's important to point out that each bonus you have is a mini-offer of a sorts... so they all can have individual scarcity or urgency that builds up inside the prospect.

For example... if you couldn't come up with scarcity or urgency for your offer... you could make it so your bonus would switch every month... so you have a christmas bonus for december, a new years bonus for january, a valantines bonus for february and so on... doing that will give some urgency to the prospect.

And even if there is already scarcity or urgency on your core offer, adding it to the bonuses only makes them do their work better.

Let's start with scarcity, there are 4 ways to "create scarcity"

Only accepting X Clients (single number cap for business) and we don't know when we will be available again:

This is the type of scarcity I use for my agency.

I can only handle one client, and since it was completely performance based,

I didn't know when I would be available again.

You can use this very effectively if you decide to do something crazy and you'll only do it again depending on the results.

And even though this a powerful one, it's not even close to this one:

Only accepting X Clients (single number cap for business) and once it's sold out, you'll never be able to get it again.

For example, if the clients stay on for years on end, you'd like to serve them, or maybe it's a special offer.

I can't think of an example for this but it's good to keep in mind that it exists so that if you eventually come across an offer like this you can use it.

Only accepting X clients per week (cap on per week basis),

If it's coaching sessions for example you don't want more than 5 people per session and you do them weekly

If you do coaching calls you can also have your calendar filled,

(or do small group sessions and you don't want to have more than 10 people on call)

Only accepting X clients per "class"

Universities, use this a lot, we can only take 300 students, so enroll quick, or you'll have to wait until next year.

Now that was scarcity... hopefully you can already start thinking on how to frame your stuff.

Then after these 4, we still have urgency which has the other 4:

Cohort Based (the next group starts next week)

This type of urgency says that:

"You'll want to book before the day of the session,

To make sure you won't have to wait until next week, and that gets people to take action."

Rolling Seasonal Urgency (the end of our spring extras is around the corner)

This was what I did a while ago with the bonuses..

- in december you can have a christmas extras,
- in january you can have a new years promo,
- in february valentines day
- and so on...

Pricing/Bonus Based Urgency (these bonuses are going away)

A good example on this is on the bonuses. You can put urgency on the bonuses,

Just put a set of bonuses for each month of year and call them valentines bonuses and stuff like that, and then use it.

Like you just did on the other one... but this one is special because they won't come back...

If your doing an offer that will only be here for a month or two and then it's gone forever... then it's a great opportunity to use this.

Exploding Opportunity (you can wait, but the opportunity gets smaller every second)

This is the best type of urgency, it's what got so many people hooked into bitcoin in 2019.

Unfortunately, I was not able to come up with an example for this but they are the best type of urgency... so if you ever the possibility... use it.

Step 11...

Give it a name (not headline)

After you've created your offer... it's time to give it a name... this is not the headline... it's the name of the offer.. and to create it... we use the magic formula. Which is a formula for naming stuff.

By the way... bonuses are mini-offers... so you should give them a name in the same way.

1. Give a magnetic reason why you are doing this

The first element is giving them the reason why you are giving out this offer. For example:

Spots Opened: 6-Week Winner-Athlete Challenge

The bolded "spots opened" is the reason for giving this ad to you right now. Now, I DO NOT recommend using discounts as incentives, *I probably said this before though right...?* Here's what you can use:

- Urgency (rolling cohorts, webinar event deadlines)
- Scarcity (Spots opened, X spots left)

2. Announce the Avatar

The avatar is the target, word selection is important because we must be the most targeted about this possible in few to little words, and making it understand to the audience what we're saying.

Spots Opened: 6-Week Winner-**Athlete** Challenge

Athlete is pretty narrowed down, if you wanted to narrow down even more, on my example, I could:

Spots Opened: 6-Week Marathon-**Runner** Challenge

I also changed the goal for it to make sense.

3. Give them a Goal

This is the big reason why they should buy, let's go back to our example:

Spots Opened: 6-Week **Marathon**-Runner Challenge

The big goal is becoming a marathon runner, which acts both as a audience callout and goal.

4. Interval

Next you need to mention the interval, more time means less value, and you need to use your speed as a selling point, so, in my example:

Spots Opened: **6-Week** Marathon-Runner Challenge

On lead magnets you want to think weeks, days, hours. On bonuses seconds, hours, days. And offers: days, weeks, months or even years, if you're targeting

enterprises (though on that we don't use advertising most time, but more of a networking approach, which is not my domain)

5. Container Word

There's no sexy way of saying that, it's a way of the prospect to memorize, and it is in most times.

Spots Opened: 6-Week Marathon-Runner **Challenge**

This framework is given by Alex Hormozi by the way...

And after all this, you will have created your offer... now... it was a ton of work... but it was worth it... because now.. I am going to go over incorporating these offers into your business and creating new ones... now I am not asking you to create another offer... you eventually will need to. I won't lie about that... but not right now... so don't worry.

What we'll go over is how it works... how it weaves together... so let's go to substep 2

Increasing the LTGP of your offers and decrease the CAC

First we gotta talk about what do these terms mean, where they are used and why they are important.

LTGP stands for lifetime gross profit. Which means... the whole lifetime of the prospect.. how much money will they give you... minus the cost of delivery...

So, let's assume you only sold consultations and on average a client would buy 3 consultations 200\$ each and never come back... and let's also assume that the consultation included a free supplement. For the sake of the example.. not saying you should do this... and let's say that each supplement was 16\$

Then your gross profit would be $200\$ - 16\$$ and that value multiplied by 3, which is the total amount of times they buy. That would give you 552\$... which is the LTGP per client on this example...

Which is very low... and I'll tell you how to increase it in a second... but now... let's talk about CAC...

CAC is essentially the costs to get the person that will pay you the 3 consultations... it literally stands for Client Acquisition Cost. And believe it or not... this is usually what marketing agencies fix... we go a bit a bit beyond that... but it's mainly that... how?

Well think about it.. by increasing conversions we're getting more per each lead that comes in.. reducing costs...

Now... personal trainers DO NOT get this at all... because they make content... but when making content... your resource is essentially your time... take your consultation price and divide it by 3 and multiply it by the number of hours you work a week... any other costs such as tools like email marketing software or supplements and so on are also part of the CAC and should be added to it...

REALLY hope that the editor is putting an example on screen.

Now... why are these metrics important, you can already get an idea... one tells how much you make per client, another tells how much it costs to get one... so

they are pretty important because they give you essentially an overview of your whole business model.. and how well it's doing...

But they are even more powerful when combined together into the LTGP:CAC ratio... and this ratio basically tells us 1 think:

If I put in 1 dollar into my business, if I do the work, how much would I get back? You see business is a machine... you put in effort, time, leads, money and get money out... how much money gets out is LTGP, the money that gets in the CAC. Effort and time are also important as you can guess but you probably apply that, and hell if you don't have the raw material, leads, you can't do anything... but we'll talk about getting leads in the door in step 2...

A good ratio is putting 1 dollar in to get 3 dollars out... any less and you're grinding and working hard for nothing...

The bigger the discrepancy the better... Ok.. so how do we increase the discrepancy... NOW... we'll get to what the section is about...

Let's start with increasing LTGP... you have a few options:

More Offers

Another Person's Offer

Increase the Price

Increase the Volume

Let's go over them...

More Offers

It doesn't mean you'll need to go through that nightmare again don't worry... there are a lot of options... the first.. and most simple is that you could start by simply creating a better version of your offer.. increasing the price.. and making that an upsell.. It will take a few hours to do this... you'll have the increase the value by at least 5 times... to calculate that just use the formula...

But the best part... is that this can be done over time... you can over weeks just keep increasing the value until you get to a 5X and then make it an upsell...

Now you might be asking... why 5 times? The answer is simple: because 20% of people purchase, so if we increase the value by 5 times... we can put the upsell at 5 times the price of the original thing and 2X revenue...

Now, of course... you need to do a good job converting to get those 20% of people... but it's usually how it goes... there are 20% of people who have 5 times the buying intent.

And you can repeat this over and over as you audience grows... hell... if you don't like to create offers from scratch... you honestly COULD just do this... however

that will leave a lot of untouched opportunities and sometimes you get stuck making something better....

When that's the case, you want to use these other methods to create more offers:

Create a worse version of your thing

Think of things that you could offer that go well with the thing you're selling right now

Create a different version of the thing

Let's start with creating a worse version of your thing and why you should do it...

Imagine there is a person who you want to help but they are asking for a price that you just can't, the price is too low... you could create another option for them that's worse than your current offer... but will help them... this usually is like passing from group coaching to courses or from 1-1 to group coaching...

But it's just something which the cost to deliver is 5 times less... and the value... as high as possible.. that usually means making it more towards the 1-many and doing it more towards DIY solutions... but that's a generalization... watch out because there are special cases.

This is called the tesla pyramid principle... and it was created by Alex Hormozi... when you start out you want to be expensive... but good... and as you scale... you

create more cost efficient offers that offer a bit less value compared to the thing you started out from... so if you look at the vertex you can see this clearly:

[Tesla Pyramid]

Then we have things you could sell that go well with the thing you're selling right now...

If you're selling a flexibility program for example... that can go well with a nutrition course.. and then you can grab the guys who are on flexibility and tell them "hey I just opened this new nutrition thing, do you want to have a look?"

Another option is to make a different version of the thing...

This is for example: do you want a flexibility program or a nutrition program... do you want a weight loss program... or do you want a strength training program...

Then over time... you can put clients into multiple of these and increase LTGP

Another option you have is...

Another Person's Offer

In other words, affiliates... like an affiliate supplement company that increases LTGP... pretty simple... pretty effective.

As your thing gets better you gain the option to...

Increase the Price

And it's also a pretty effective way to get a higher LTGP... you literally increase the price.

The last option is to...

Increase the Volume

This is getting them to buy the same thing more times... consultations... group calls... 1-1 training with a recurring revenue etc... to do this you need loyalty programs... that will be one of the bonus sections at the end of the video series... so don't worry about that...

Now... to actually decrease CAC there are options.. you could reduce steps to stop people from NOT converting and you could increase conversions on each step... this is the funnel badically... it's just:

Increasing that chance is the job of marketers and conversion rate experts... especially on the long term... but usually... conversion rate experts are

dumbasses... I see so many focusing on button colors for some reason... they are idiots.

There is no silver bullet in CAC... it's a bunch of tricks to reduce conversions... there are trends based on human nature... but your knowledge has to be pretty broad... that's why I usually give people who want success on their sales pages and other things... checklists and frameworks... so they don't need to have the knowledge or think about it.

But the resources section is already *pretty* big and I would add at least 10 more resources if I did that... and we're still on step 2... plus I don't actually know if that's what you need to optimize right now or something else in your funnel... please do check our strategy call on the big button below this for that...

But yeah, enough advertising... now... let's get to step 3...

Reduce price of delivery

Like CAC, reducing the price of delivery comes down to bunch of small tricks... however the biggest one is using data and automation...

You see, your time adds to the cost and it's probably the thing that's heaviest.. to optimize that we can use automations.. to use automations we need data... now we already got data points set up through analytics, forms and stuff like that but for time... I mean other data...

From now on I want you to every day document what you do... then once per week you see that you just documented and ask: is there ANYTHING at all that is repetitive and doesn't involve a high level of thinking or expertise...

Breaking it down to the hour has enough accuracy... if you have bad memory and can't remember what you had for lunch like me.. document every 3 or 6 hours...

After finding something that is repetetive and can be automated.. just find a devoloper... a freelancer online... ask them what you want or post a job... and then if the price is less then the price of 1/3rd a consulation... ask them to do it... and just like that.. you've save 4 or more hours per week.. which is a lot of money...

You'd be surprized by the ammount of things that can be automated by data...

This is really all your need to reduce delivery price as a personal trainer.. it's all the same for programs and courses. This framework applies nonetheless.

Reduce break even point.

[you have this in the slides, attach it]

Funnel Structure

Alright... now it's time to put it all together... it's time to put together all the offers we did... break even point techniques and so on... into a funnel... now this is not hard... I've created a framework for this.. so that we can do this in a snap...

First things first... there is no single best funnel... this is not math.. there are several styles and paths we could take to make a good funnel...

Second.. funnels get better over time...

So here's what I'll do... I'll break down the whole funnel into lego pieces... I'll tell how those pieces combine together and the best combinations I've found... each of these pieces is taken from successful funnels... after that you frankenstein them together and test what works best over time... + what kind of work is related with them

That honestly seems to be, the most applicable and scalable method I could find to helping you with this...

Lego Piece Funnel

So, I've recorded that separately and left it in the resources..

Ok... now we've concluded step 1... that's it... I hope you've applied all I've asked you to... I hope you have taken notes... and you're excited for step 2, which is next.
